opposite integers Two integers with the same numeral, but different signs. Two integers represented by points that are the same distance in opposite directions from zero on a number line.

$+2$ and -2 are opposite integers.
opposite operations Operations that "undo" other operations. Some people call them "inverse operations."

Addition and subtraction are opposite operations.

Multiplication and division are opposite operations.

order of operations Correct sequence of steps for a calculation. Brackets first, then multiply and divide in order from left to right, and then add and subtract in order from left to right.

ordered pair A pair of numbers used to locate a point on a coordinate grid.
origin The point where the x-axis and the y-axis cross.

outcome One possible result of a probability experiment.

outlier A value that is much smaller or larger than the other data values.

overestimate An estimate that is larger than the actual answer.

P

parallel Describes lines in the same plane that never cross or intersect.

parallelogram A four-sided figure with opposite sides parallel and equal in length.

pattern An arrangement of shapes, colours, numbers, letters, words, and so on, for which you can predict what comes next.

percent Means "out of 100" or "hundredths."

30% means 30 hundredths or 30 out of 100 or $\frac{30}{100}$ or 0.30.
perimeter The distance around the outside of a two-dimensional shape or figure.

perpendicular Describes lines that intersect at right angles (90°).
right angle

perpendicular bisector A line that divides a line segment in half and is at right angles to it.

pi The ratio of the circumference of a circle to its diameter. The symbol for pi is π.

probability The likelihood or chance of an event occurring. Probability can be expressed as a ratio, fraction, or percent.

proper fraction A fraction that has a numerator less than its denominator, such as $\frac{2}{9}$.

Q

quadrants The four regions on the coordinate grid.

R

radius The distance from the centre of a circle to the outside edge. Represented by the variable, r.

radius
random An event in which every outcome has an equal chance of occurring.

range The difference between the largest and smallest values in a data set.

reflection A flip over a mirror line.

line of reflection
relationship A pattern formed by 2 sets of numbers.

repeating decimal A decimal number with a digit or group of digits that repeats forever. Repeating digits are shown with a bar.

$0.777\ldots = 0.\overline{7}$

rotation A turn about a fixed point called the centre of rotation.

centre of rotation
S

sample space All possible outcomes of an experiment.

sector The section of a circle formed by two radii and an arc of the circle connecting the radii.

sector   arc

semi-circle Half of a circle.

T

table of values A table showing two sets of related numbers.

tally chart A table used to record experimental results or data. Tally marks are used to count the data.

terminating decimal A decimal number in which the digits stop.

0.4, 0.86, and 0.25 are terminating decimals.

theoretical probability The expected probability of an event occurring.

transformation Moves one geometric figure onto another. Examples are translations, reflections, and rotations.

translation A slide along a straight line.
tree diagram A diagram with a branch for each possible outcome of an event.

U

underestimate An estimate that is smaller than the actual answer.

unit fraction A fraction with a numerator of 1.

$\frac{1}{2}, \frac{1}{3}, \frac{1}{4}$, etc.

V

value A known or calculated amount.

variable A letter that represents an unknown number.

In $2x + 4$, the letter x is the variable.

vertex A point where two sides of a figure meet. Plural is *vertices*.

vertex

W

whole number Any of the numbers 0, 1, 2, 3, …

X

x-axis The horizontal number line on the coordinate grid.

x-coordinate The first number in the ordered pair describing a point on a coordinate grid.

The x-coordinate of point $P(2, 5)$ is 2.

Y

y-axis The vertical number line on the coordinate grid.

y-coordinate The second number in the ordered pair describing a point on a coordinate grid.

The y-coordinate of point $P(2, 5)$ is 5.

Z

zero pair A pair of integer chips, with one chip representing $+1$ and one chip representing -1. The pair represents zero because $(+1) + (-1) = 0$.
